

## Tkinter GUI designer

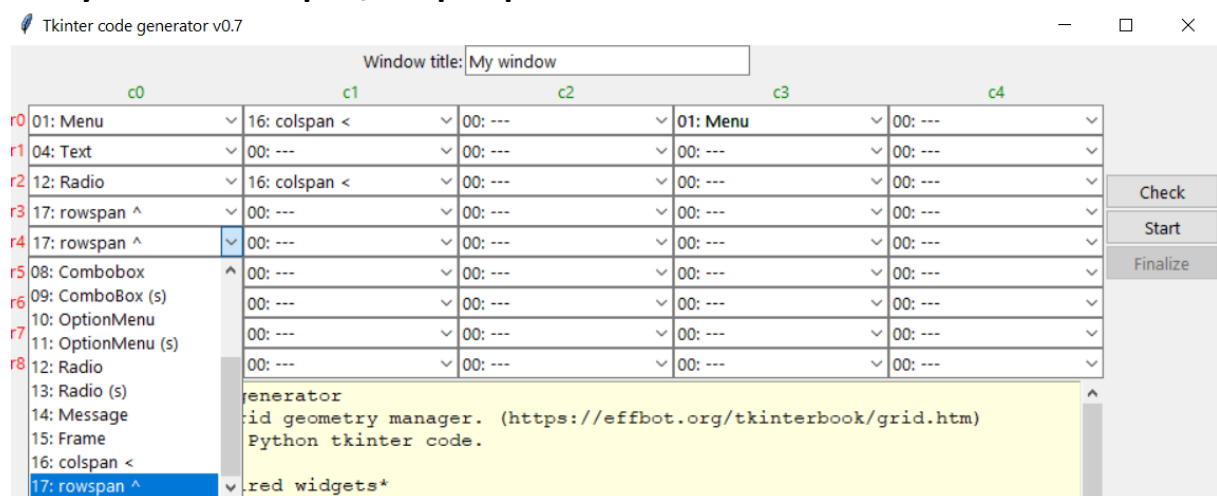

It is written in Python and you will get pure Python tkinter code.

It uses tkinter Grid geometry manager. (<https://effbot.org/tkinterbook/grid.htm>)

### 1. Select the desired widgets\*

### 2. If you use rowspan/colspan press "Check" button

Tkinter code generator v0.7

Window title:

	c0	c1	c2	c3	c4
r0	01: Menu	16: colspan <	00: ---	01: Menu	00: ---
r1	04: Text	00: ---	00: ---	00: ---	00: ---
r2	12: Radio	16: colspan <	00: ---	00: ---	00: ---
r3	17: rowspan ^	00: ---	00: ---	00: ---	00: ---
r4	17: rowspan ^	00: ---	00: ---	00: ---	00: ---
r5	00: ---	00: ---	00: ---	00: ---	00: ---
r6	00: ---	00: ---	00: ---	00: ---	00: ---
r7	00: ---	00: ---	00: ---	00: ---	00: ---
r8	00: ---	00: ---	00: ---	00: ---	00: ---

Buttons: Check, Start, Finalize

- All common merged cells will be disabled (for example c1-r3, c1-r4 on screenshot)
- Rowspan must be placed under the expanded widget
- Columnspan must be placed to right side of the widget
- Maximum 4 column and 4 rowspan cells can be selected for one widget (rowspan/colspan=5)
- If you use colspan and/or rowspan press "Check" button to check your selection.
- All misplaced span selection will be reseted
- Canvas and Menubar does not accept col./rowspan

### 3. Press "Start" to generate codes

Related option widows open

Radio options: c0, r2

Text options: c0, r1

Menu options: c3, r0

Menu options: c0, r0

### Menubar

Menubar options: c0, r0 (m)

Mainmenu (1st row) -> File

Submenus -> {

separate: -

checkbox: # (e.g: #yes)

orient. N

Apply

Settings

Tools

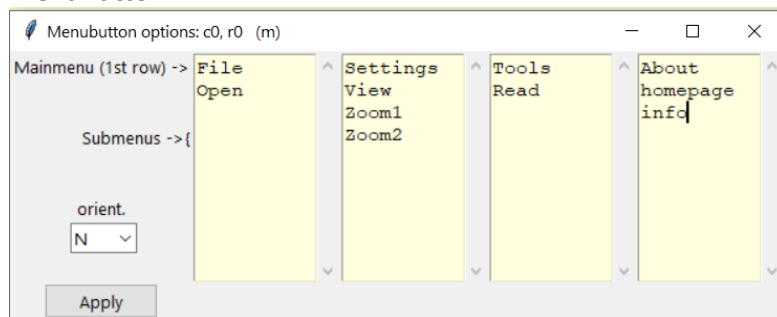

About homepage info

You can put 4 main menu (top blue line) and any submenu

First row: main menu (x4), other rows: submenu (any)

Available settings: separate: '-' ; checkbox: '#' (eg: #yes)

## MenuButton

You can put 4 main menu (top row) and any submenu  
Available settings: orientation.

## Button

You can put 3x4 button in a frame. (min 1 button max 12button)  
Available settings: orientation. N- North, E-East, S-South, W-West, NE,SE,SW,NW, N+S (expand between max N and max S), E+W (expand between max W and max E)

## Canvas

Available settings: Orientation, width

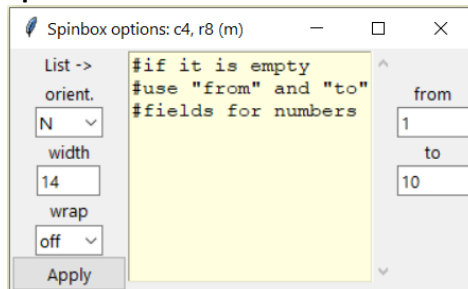

### Scale

Available settings:

scale label, from, to, resolution, scale length, scale width, thickinterval, set value, widget orientation, scale orientation, show value

### Spinbox

Available settings: from, to, wrap, list items, width, orientation

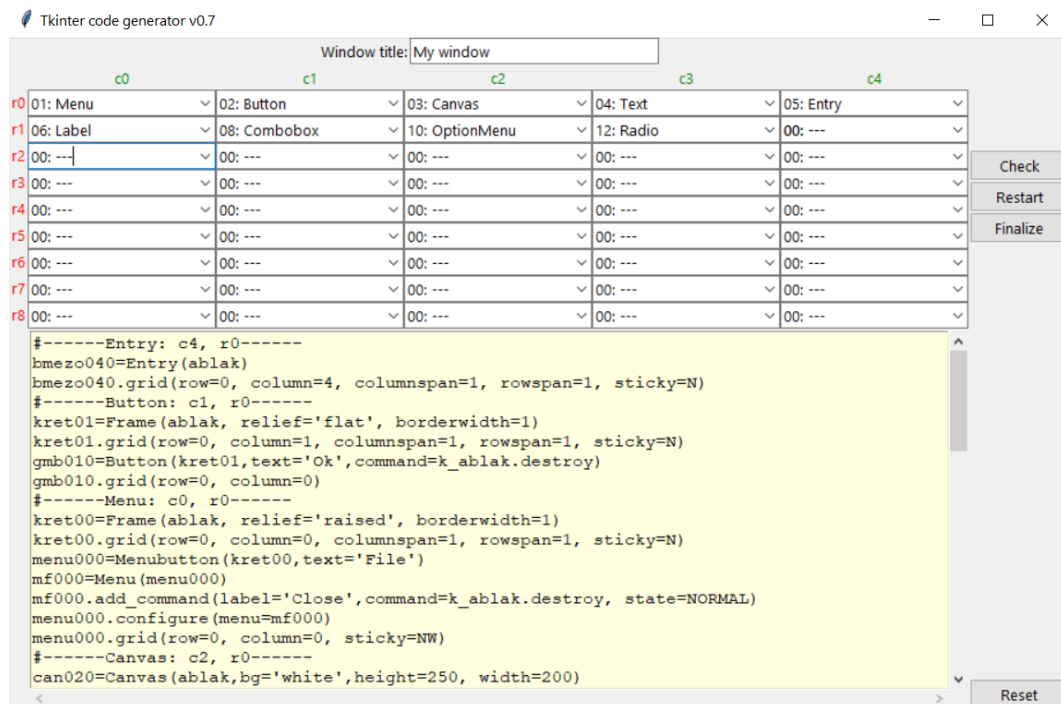

### Progressbar

Available settings:

length, maximum, start value, widget orientation, progressbar orientation, mode

## 4. Set the opened options windows and Apply

Your code is not done yet, you have to finalize it.

## 5. Press "Finalize" and copy the generated code with Ctrl+C

### Hint:

- rowspan must be placed under the expanded widget
- colspan must be placed to right side of the widget
- maximum 4 column and 4 rowspan cells can be selected for one widget (rowspan/colspan=5)
- if you use colspan and/or rowspan press "Check" button to check your selection.
  - all misplaced span selection will be reseted and
  - common merged cells disabled
- Canvas and Menubar does not accept column/rowspan
- Open second session of Python IDLE and use it for checking the generated code without closing the running GUI generator
- widget name with (s) like 'Label (s)', 'Combobox (s)', 'Optionmenu (s)' and 'Radio (s)' means simple. It uses default parameters and does not open option window.

### Supported widgets:

manubar (4x any), menubutton (4x any), button (4x3), canvas, text with scroll, entry, label, combobox (4x3), optionmenu (4x3), radio (4x3), message, Universal Frame, Listbox, Scale, Spinbox

*Note: I am not professional Python programmer, but I hope you can use it and it can help you to create Tkinter GUI much more easier.*
